

Use our probability factors grid to forecast the likely value of key account projects to your organisation. The tool can also be used to help senior managers coach.

Is there an OPPORTUNITY for us?	How clearly defined is the project? Does it have a high level of importance for them? Is there a budget for it? If not, could they find the money? Is there a compelling reason or event driving this project along – do they have to go ahead?
How COMPETITIVE are we?	Do we have good relationships with all of the key decision makers and decision influencers? Do we know how the decision making process actually works – who talks to whom, in what order? Do we really understand their needs and how well does our solution match the needs? How many of our competitors are also pitching for this business and what do we know about their progress? Are we inside the budget?
Is this WINNABLE?	Are our “allies” within the account rooting for us? Do we have proven expertise and experience of this type of work? Is there a good culture-fit between our companies? Are their company politics likely to affect us? Can we prove a good return on their investment?
Is it WORTH going for?	Will it be profitable for us in the short term? Will it be profitable for us in the long term? Does it have good “strategic” value for us? Will it be a profitable relationship for the customer? Is it worth all the time, effort and hassle?

If the value of the project is £50,000 but the measured probability is 60% ... then the forecast value of the project = £30,000

TIPS FOR USING THE GRID

- If in doubt mark yourself down as it will force you to find more new suspects.
- If the probability is less than 50% maybe you should not include it in any forecast (the last thing you need is a £500k piece of potential business with a 10% probability).
